## Executive Summary

The City Centre Regeneration and Investment Strategy identified car parking as a major issue for Belfast city centre and recommended that the council work with the Department for Infrastructure to develop and implement a strategy for car parking for Belfast. The council wish to provide a strong civic leadership role for the promotion of a modern, safe, accessible and integrated transportation system for the city of Belfast and its wider regions.

The role of parking in contributing to the success of a city is recognised, however it needs to be effectively managed as part of a balanced approach. Our rationale for developing the strategy is to ensure that parking supports the local economy by making it easy for shoppers and tourists to visit Belfast and provide access to key services and facilities for special needs groups and the mobility impaired. It is important that the Car Parking Strategy for the city encourages sustainable travel modes and helps reduce reliance on the private car whilst enhancing the built and natural environment.

The Car Parking Strategy makes recommendations relating to council owned car parks and car parking provision outside our ownership. A key component of the strategy is to facilitate and encourage stakeholders to work together to achieve the vision and objectives.

### Vision

"Belfast is a city offering sufficient, high quality and appropriately located parking which supports economic development and regeneration within the city by balancing the requirements of residents, businesses, commuters and visitors."

**Objective 1 -** Ensuring appropriate provision and location of car parking to support and improve the economic vitality of the city centre and district centres.

**Objective 2 -** Ensuring car parking provision encourages sustainable commuter travel, especially for journeys into the city centre and supports access by public transport, cycling and walking.

**Objective 3 -** Minimising the potentially negative impacts of parking on residential communities in the city particularly in inner city areas.

**Objective 4 -** Work with stakeholders to improve the quality of parking and information available, ideally through technology and in particular develop a new parking signage and information system that supports parking and wider applications.

## 1 Introduction

The city of Belfast is changing. It is growing and continues to seek more investment, more jobs, more opportunities, and to be a better place to live. The city's transportation network and in particular parking have a key role to play in achieving a vibrant competitive city which can compete on a global scale.

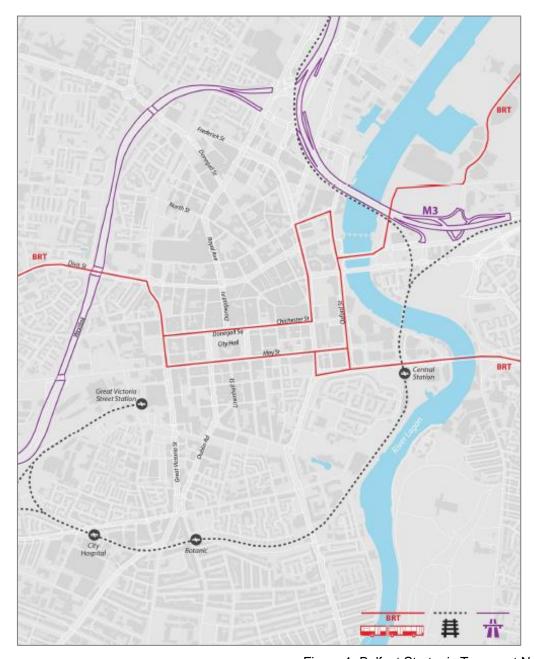

Figure 1: Belfast Strategic Transport Network

In recognition of the role of parking in contributing to the success of the city, and as outlined in the City Centre Regeneration and Investment Strategy published in September 2015, a strategy for city centre parking is needed. The actions and interventions proposed here will complement the Regeneration Strategy's following core principles: increasing the

employment and residential population; managing the city's retail offer; maximising tourism opportunities; creating a green, walkable and cyclable city centre; create regional learning and innovation centres; and promoting shared space and social impact. The actions and interventions within this document include the innovative use of technology to make parking 'smarter' and promote better use of city centre space to provide the right environment for investment and for city users and while enabling further city development.

On 1 April 2015, the Department for Regional Development (now renamed the Department for Infrastructure – DfI) transferred all of its off-street car parks (excluding Park and Ride/Park and Share) to local councils as part of local government reform. The council is responsible for the operation of thirty car parks that were previously operated by the DfI, however on-street car parking remains under DfI's control along with other transport responsibilities.

Local government reform also provided local councils with a range of new place-shaping and economic powers including developing a new Local Development Plan as part of the wider planning function and community planning. This strategy will seek to inform the development of future statutory plans and policies developed under our new powers.

The current parking strategy is set out in the Belfast Metropolitan Transport Plan (BMTP) and is currently under review by Dfl.

Figure 2: Belfast Metropolitan Transport Plan (Dfl) – The BMA's Transport Network As outlined in the City Centre Regeneration and Investment Strategy, fundamental to Belfast's success will be the city's ability to continue to attract investment and retain a competitive advantage over other cities. This means being competitive in terms of tax, rates, skills and incentives. But it also means having a lifestyle offering that will attract and retain people. The role of transport and car parking is clear: they are key elements of how a city functions, not only in terms of business but including the broader 'lifestyle' offering. Car parking clearly is an important resource that supports the economic and social vitality of the city, however, it also can have some negative impacts that need to be effectively managed and addressed. Primarily these issues are associated with inappropriate parking provision. For example, a high proportion of all day commuter parking in the core of a city centre uses up valuable space that could be used for broader regenerative purposes and restricts parking opportunities for shorter term uses such as shopping, business and leisure activities. Similarly, the ability of commuters to park for free in predominantly residential areas prevents those residents from parking and negatively impacts on the quality of the area and can undermine the viability of local businesses that depend on a turnover of parking spaces.

This Strategy was developed through close working relationships between Belfast City Council (BCC), Dfl and Transport NI (as the highway authority), as well as consultation with elected members, members of the public and other city stakeholders. A joint approach with these stakeholders will be needed in order to achieve the objectives within the Strategy and for Belfast to fulfil its role as the capital city and the economic driver for the region.

## Context and baseline review

It is important to consider why people need to park as this is fundamental to understanding how the issues should be addressed and also the impacts that peoples' parking choices have, as many parking issues are common in numerous towns and cities. The review considers parking within Belfast city centre, examining parking supply, location and the current approach to policy.

### 2.1. Why people park

For many people the private car is an important means of accessing Belfast, particularly for trips to work, shopping and leisure. Most of these trips result in parking near to or at the intended destination. The availability of somewhere to park is therefore a key consideration for these users, however, parking cost and convenience are also significant influences as is the availability of practical alternatives including use of public transport.

Some users may only need to park for a few minutes or for a few hours, such as if they are attending a meeting, using their car as part of their job, going on a shopping trip or visiting a tourist attraction. However people who park for work often need to make use of a single parking space for upwards of eight hours per day.

Any consideration of parking needs to take into account the various reasons why people need to park their vehicles. It also needs to consider whether these parking acts need to be made at all if other transport options offer the user a viable alternative. A careful balance is needed between the level of parking provided and the comparative viability of using other forms of transport to make the same trip.

Within cities, it is the movement, connectivity and transportation of people that can be key drivers to promoting and sustaining economic growth. Parking is a crucial strand of delivering a 'joined up' city transportation strategy, and Belfast is no exception. As the city continues to grow, both in terms of population and employment, pressures on the transport network will increase and therefore careful ongoing management and planning are required.

### 2.2. The impacts of parking

Whilst an efficient city parking system can help to sustain a local economy, there are a number of considerations needed in order to reduce the adverse impacts that parking can have. These can be attributed to a combination of user behaviour and the level of infrastructure provision. For example, some users may have always parked in particular locations, yet there may now be unacceptable local impacts associated with this activity. In other areas, an over-supply of free or cheap parking can increase traffic congestion on adjacent roads.

When excessive demand materialises on a road network with limited capacity, it results in congestion for all road users. This impacts on journey time reliability, delivery timeframes for goods and services and adds to driver frustration. There are also impacts on the environment through increased air and noise pollution.

Cities typically experience large demands on their transport systems, and an abundance of parking supply can create high competition for limited road space due to large numbers of drivers looking to park their vehicles. As can be seen at many out of town shopping centres, there is an intrinsic link between abundant parking provision and large private car demand. Yet in comparison with out of town sites, cities offer more viable travel alternatives to the private car through public transport provision.

Careful consideration of parking supply within cities is needed in order to achieve an appropriate balance that meets demand yet does not encourage less sustainable travel, particularly by commuters. As city economies grow, working and resident populations both increase and this causes additional pressure on existing transport networks. In order to maintain the effectiveness and lifespan of a city's transportation system, people need to be able to make an informed choice on their method of transport to work/study, and ideally users should see mass transit systems such as bus or rail travel as their preferred choice from a cost, convenience and travel time perspective.

As such, parking price within cities needs to be at a level sufficient to sustain the market yet also at a level that does not induce excessive demand, thereby undoing efforts to increase use of more sustainable transport modes. It also needs to be sufficiently competitive so that it does not disadvantage and price out certain users for whom sustainable modes are not currently a viable option. This balance can be difficult to achieve when the majority of the parking provision is operated by the private sector.

A close link between land use and transport planning is essential. This means that new development is located in areas that have suitable means of access by a variety of transport modes and ensures prime development land is not inappropriately used for low quality surface-level car parking. Many city buildings such as offices provide their own parking spaces, such as basement parking or lock-up car parks mainly for employee use. Such spaces are typically not publically available and are termed 'Private Non- Residential' (PNR). Whilst this provides additional parking capacity within cities to accommodate the demand which is arising from development, the level of PNR parking needs to be carefully considered in order to avoid inadvertently maintaining car dependence and adding to traffic congestion. In city centre locations where public transport access is good, the need for large numbers of PNR spaces is questionable.

Parking space also needs to be provided for tourist coaches, preferably close to attractions so that passengers can be dropped off. Lack of coach parking space can cause tour operators to think twice before planning city excursions, however, it can be difficult for local authorities to find suitable parking locations within heavily built up city centres. Similarly, tourists and other visitors arriving by car can often be unaware of parking locations and a lack of signage and information can compound this issue.

All day parking, where a vehicle is continuously parked in the same spot, can take place in inappropriate locations. This includes commuters who park in mainly residential areas; preventing local residents from parking, adding to the cluttered feel of individual streets, decreasing perceived safety levels and reducing access for emergency service vehicles.

A high proportion of all day parking can also use up valuable space for people who need to park in the city for short durations such as for business meetings or for shopping. Typically this is more an issue with on-street rather than off-street parking spaces, but the result is that the turnover of high value spaces is low which means that people spend time circulating to find a space or are ultimately dissuaded from visiting an area altogether.

The majority of parking acts require enforcement systems to ensure effectiveness. Enforcement can assess whether parkers have stayed beyond the maximum time limit stipulated on the adjacent signage, or if they are parked on urban clearways or on double yellow lines, etc. However it is virtually impossible to enforce all parking acts within any given city, and limited enforcement resources can only deal with a certain amount of parking infringements. City areas are generally split into those with parking restrictions and those where parking is unrestricted. Typically the areas with restrictions are city or local centres; however any restrictions are reliant on enforcement.

Aside from not abiding by parking regime rules, users have been known to abuse the system in other ways such as 'feeding the meter' which enables users to stay in the same space beyond the time limit stated. Similarly, misuse of Blue Badges enables people without genuine disabilities to park on-street all day for free. The effects of this behaviour are reduced space turnover and an increase in circulating traffic looking for a parking space as well as annoyance to local residents and businesses.

Increasing volumes of cyclists are being seen throughout the UK and Ireland, with many cities also implementing bike hire schemes. In order to sustain this recent level of growth the overall offer to cyclists needs to be improved, and this includes provision such as dedicated cycle lanes and cycle parking. In the absence of suitable and secure parking, cyclists often have to lock their bikes to street furniture which adds to the feel of cluttered streets and leaves their bikes exposed to the elements.

The lack of good quality parking provision for cyclists can add to crime levels and perceived safety fears, which can also be apparent in low standard car parks. If such sites are located in areas of high vehicle or personal crime, are poorly lit and unsurfaced or unmanned and without CCTV, users feel unsafe and therefore park elsewhere. A lack of provision for disabled users and adults with children can also decrease car park attractiveness. Disabled or limited mobility users in particular are often dissuaded from paying for parking off-street when they can park for free on-street and closer to where they want to go to.

Taxis perform a vital public transport service within cities. They offer convenient door to door transport at all times of the day. To ensure availability to customers, public hire taxis need sufficient on-street rank space to be able to wait and private hire taxis also need parking space while they await instruction on customer pick up.

Where the public hire rank space provided is not commensurate with taxi supply, overcrowding occurs and this can impact on the local area and impinge upon traffic flow. This detracts from the overall taxi offer, ultimately affecting the local economy.

### 2.3. Parking in Belfast

### Parking supply and demand in the city centre

The first consideration is how much parking supply and demand there currently is within Belfast. Within the city centre's Controlled Parking Zone (CPZ), which is divided into core and fringe sub-zones, there are approximately 28,300 publicly available parking spaces, split as forty-five per cent on-street and fifty-five per cent off-street. These zones are shown in Figure 3.

Within the core and fringe zones there are 12,800 spaces where on-street parking can take place, of which only fourteen per cent are currently 'controlled' i.e. have an enforced time limit or payment regime, predominantly located within the core zone. This means that there are 9,100 (eighty per cent) uncontrolled spaces located in fringe areas such as the lower Shankill and Crumlin Roads as well as Donegall Road and Lower Ormeau. There are also nearly 1,900 spaces within the core that remain uncontrolled.

There are a further 15,482 off-street spaces within the core and fringe provided in fifty-eight car parks. The council recently received responsibility for 1,476 of these off-street spaces within seventeen car parks (two of which are free), with the remaining 14,006 being provided within forty-one car parks predominantly provided by private sector operators.

Fourteen multi-storey car park (MSCP) sites provide around fifty-eight per cent of the total number of off-street spaces within the core and fringe, again predominantly provided by private sector parking operators although a small number are provided by public sector bodies.

The remaining forty-four sites are small surface level car parks which typically provide fewer than one hundred spaces each. The condition of some of these sites is low quality, with poor signposting on approach. It should be noted that some of these surface sites could be redeveloped; therefore the use of these sites for parking purposes could be considered on a temporary basis. If redeveloped, these sites could be put to more appropriate uses.

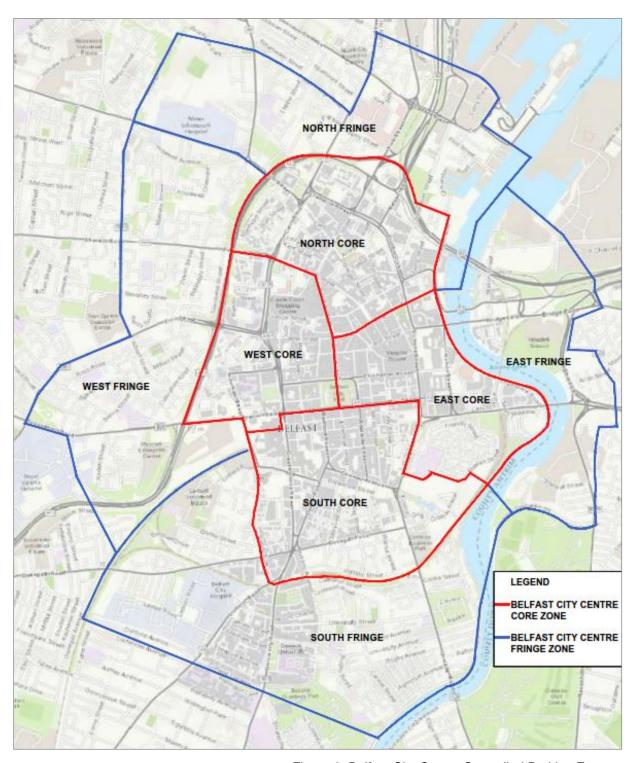

Figure 3: Belfast City Centre Controlled Parking Zones

There are also a number of car parking sites that are not generally publicly available but privately owned or contract operated. Often these are associated with businesses and offices and are PNR spaces. Within Belfast city centre's core and fringe zones there are over 10,400 PNR spaces, split as around 6,700 within the core and 3,700 in the fringe.

This gives a total parking supply of 38,681 spaces within the city centre core and fringe. Note this excludes those provided at supermarkets and out of town shopping centres. The breakdown of spaces in the core and fringes respectively is shown in Figure 4.

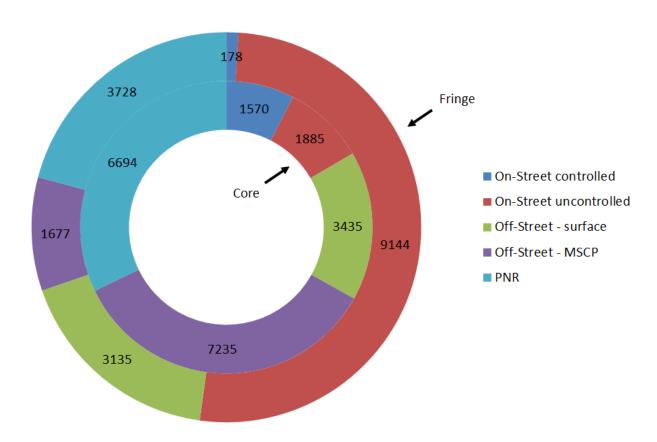

Figure 4: Approximate Number of Spaces in Core and Fringe Areas of Belfast City Centre

Day to day demand for off-street parking spaces typically uses fifty-sixty per cent of capacity at any one time, according to biennial surveys undertaken by DfI that have taken place over the last decade. On-street spaces typically have higher occupancies at between seventy-eighty per cent on average, with around ninety per cent of spaces in the core and seventy per cent of spaces in the fringe being used. Demand also changes throughout the year, particularly in the run up to Christmas when demand is high.

According to the DfI surveys, the level of parking in the city centre has remained relatively constant over the last decade. This means there are around 18,000 parking acts within the city centre at any one time on a typical day. This equates to around 9,000 parking acts in each of the core and fringe areas, and this excludes PNR usage figures.

It should be noted that the south fringe area shows the highest level of on-street parking of all of the areas considered (4,000 acts at any one time). This includes areas around Queens University and City Hospital where no parking regime is currently in place. Within the core, the level of off-street parking is relatively equally spread out, however the demand for onstreet spaces in the south core area (which includes the Linen Quarter, Donegall Pass and Sandy Row) is double that of other core areas. This is considered to be due to the majority of city centre offices being located in this area and limited parking regime implementation.

Figures for the use of PNR spaces are not available; however anecdotal evidence would suggest reasonably high use of these spaces since many are provided by businesses and public sector bodies for employee use.

It is therefore apparent that with typical demand for around 18,000 spaces and a supply of 28,300, there is sufficient overall public parking supply within the city centre. Occupancy in core areas, which are largely subject to parking charges is around sixty-five per cent, whereas in fringe areas where costs are significantly lower, occupancy is around seventy per cent.

It is acknowledged that some car parks are full, however others have lower occupancies. In addition, on-street provision can be completely saturated in some areas as a result of the lack of any parking regime in those areas. As a result the provision of parking is fragmented and imbalanced across the city centre.

In addition to the abundance of free parking opportunities on the edge of the city centre, the provision of PNR spaces provided is also considered to add to the attractiveness of driving into the city centre as these spaces are often offered to employees at no or modest cost. This also guarantees that people will always get a secure parking space upon arrival and therefore entrenches behaviour.

The proportion of PNR spaces provided in Belfast is considered to be high in relation to other similar size cities; in Belfast there is one PNR space per forty-six people, whereas in Cardiff it is one space per fifty people and in Newcastle-upon-Tyne it is one space per seventy people.

The number of spaces provided overall in Belfast is considered to be high compared to other cities of similar size. In Newcastle-upon-Tyne city centre there are around 9,500 off-street spaces provided, compared to 15,482 in Belfast. Provision in Cardiff is even lower, with an estimated 6,860 public parking spaces in the city centre.

This demand for parking affects the city centre in a number of ways. Most obviously it adds to traffic volumes and therefore congestion at key locations. This has impacts on noise and air pollution. Users often circulate in their vehicles looking to find a space. On-street spaces are highly valued yet it is more difficult to find a free space and users do not appear to be as familiar with nearby off-street alternatives.

It also means that some people park in unsuitable areas such as streets within city centre residential areas. Many of these streets, while sitting within the existing CPZ, do not have any time limits or parking regime. Despite there being parking capacity in dedicated sites nearby, commuters can park all day for free, just a short walk from the city centre. Feedback and observations have shown that these areas fill up very early in the morning with commuter parking.

Belfast also experiences the typical parking enforcement issues whereby some parkers stay beyond their time limits, do not pay for parking when they should or feed the meter. This means that some on-street spaces are used for longer than they should which reduces parking opportunities for others and ultimately could have an impact on the viability of the local economy.

Blue Badge holders are able to park for free on-street and there is evidence to suggest that this is a common practice in the city centre and it means users can often park much closer to their destination. Since Blue Badge holders have to pay to use off-street car parks, there is currently little incentive to use them.

### Parking duration in the city centre

The volume of people parking in the city centre suggests a significant proportion of long stay, all day parking. This is mainly associated with work related trips which normally arrive early morning and then leave in the evening.

The current on-street parking regime is designed to prohibit all day parking by limiting stays to one, two or up to four hours depending on location, for any one parking act. This aims to maintain space turnover which increases parking opportunities within the core of the city centre.

High quality off-street sites are better suited to all day parking, particularly those located outside of the central area, with multi-storeys offering the most efficient use of space in this regard. Recent surveys of the council's surface car parks have shown that nearly nine per cent of the total number of spaces are occupied at around midday, which appears the busiest time of day for parking at these sites. The surveys have also shown that some sites have very high turnover whilst others have low turnover and therefore a high proportion of all day parkers.

However there is no clear pattern apparent between the distance from the centre of the city (i.e. City Hall) and the proportion of all day parkers. An efficient system would have a lower proportion of all day parkers the closer towards the city core. This appears to be the case for car parks located on the edge of the city centre such as Corporation Street and Corporation Square where up to half of parkers park all day, however car park sites that are much closer to City Hall such as Cromac Street and Charlotte Street show up to thirty per cent all day parking (i.e. around one in four spaces at these car parks are used all day, reducing availability for short stay parkers). Other sites nearby such as Hope Street North and Bankmore Street have less than five per cent all day parkers, however all four sites are a similar distance from City Hall.

It would appear that the convenience and modest cost of parking all day at car parks such as Cromac Street and Charlotte Street are the reasons for this behaviour. Tariffs therefore need to be re-examined to ensure that all day parking takes place in appropriate locations. This is particularly important, as the Cromac Street and Charlotte Street sites are located within an Air Quality Management Area.

A number of privately operated car parks also operate contract and season ticket parking. This means that a proportion of the overall spaces within a car park are set aside for this purpose, however for some of these sites the number of contract/season tickets offered is in excess of that stated within planning conditions.

### Facilities and payment

A review of each of the individual car parks has shown significant differences in terms of quality; for example only around one in five car parks have provision for parents and children, with less than half providing dedicated spaces for disabled users.

Some car parks are completely unmanned and have no CCTV. In certain areas of the city centre there are high instances of vehicle crime and this inevitably has an impact on parking behaviour.

As a result car parks located within some areas of the city centre are not attractive to use and may be a reason for lower occupancies in these areas. At the other end of the scale, a number of the large city centre multi-storey car parks have achieved the 'Park Mark' standard, which is a scheme aimed at reducing crime and the fear of crime in parking facilities by encouraging car park operators to raise standards.

Current payment technologies for parking in Belfast include cash, credit / debit card, pay by phone, web and smartphone 'app'. Traditional cash pay and display machines are also provided on-street and off-street, however more modern systems are now available which could be further investigated.

Use of the 'parkmobile' service, which can currently be used at all DfI on-street and council off-street sites, has shown an increase in popularity and this is considered to be associated with the ease of use and payment that it provides. Ease of payment assists operations and maximises usage and revenue for providers. Some city centre residents and businesses also rent out their parking spaces to commuters via websites, often at attractive rates.

The average cost of parking across the city centre is largely commensurate with cities of similar size or characteristics such as Newcastle, Middlesbrough and Nottingham; however Dublin, Manchester and Cardiff all have higher parking costs. For the council owned offstreet car parks, the tariffs have remained largely unchanged for a number of years and there does not appear to be a strategic approach to the pricing of each car park.

### Parking information

Belfast does not currently benefit from an integrated city-wide parking signage system. While there are some localised areas that provide modern electronic signage upon approach to car parks, such as Victoria Square and Titanic Quarter, fixed plate signage is used in most locations to advise users of parking locations as they approach them.

There is an absence of information for users as they approach the city from further afield; therefore those who are unfamiliar with the city have to rely on signage information which is located just a few metres from individual car parks. This results in people circulating the city centre looking for parking spaces.

Integrated parking guidance and information systems monitor individual parking locations electronically. Data is then fed through to a communication system which advises motorists of the availability and location of parking via a network of variable message signs. Allowing the public to access this parking information before they start their journey can help them make a more informed decision and also influence their modal choice.

This could result in better management of demand and supply, potentially reducing environmental impacts through lower vehicle emissions. It would also raise the overall attractiveness of the city, leading to improved revenue generation, better utilisation of offstreet car parks and improved accessibility to short stay on-street parking areas.

### Coaches / tourism

The tourism industry and in particular the coach tourism industry is vital to both sustaining and growing the Northern Ireland economy. Local coach operators invest millions in vehicles and bring large numbers of tourists into the region that then spend locally.

There is provision for nineteen coach parking bays in the city. While these are essential for short term city centre parking, particularly for day time parking, demand regularly exceeds supply. There are a lack of facilities in Belfast and also a perceived lack of enforcement of the existing facilities. Furthermore, there is a need for off-street coach parking facilities and convenient signage for coaches and passengers, so that visitors return and to attract further visitors.

### **Cyclists**

DfI data has revealed that there are over seven hundred cycle parking locations in Belfast city centre. However with the increase in the popularity of cycling both from users using their own bikes and the recently implemented Belfast Bikes scheme, there is a need to enhance the quality and quantity of cycle parking. This should ideally include weather-protected and secure cycle parking in the locations where people want to park their bikes, and the implementation of additional Belfast Bikes docking stations at key attractors such as transport hubs, shopping centres and centres of employment.

### **Taxis**

Public hire taxis in Belfast benefit from a number of ranks from where they can pick up customers. However it has been acknowledged that there is significant competition for kerb space across the city centre and that ranks need to be better distributed across the city centre so that they more closely align with footfall in particular areas.

There are particular areas where localised issues occur due to taxi supply being in excess of the rank space provided. This pressure is likely to increase with the introduction of single tier licensing whereby private hire taxis will also be able to use ranks.

### Outside of the city centre

The council provides 720 spaces in fourteen car parks outside of the city centre. Ten of these car parks are located in east Belfast and four are located in south Belfast. The east Belfast sites are primarily located off the Newtownards Road.

Surveys have shown that the average weekday occupancy of these fourteen sites is seventy-eight per cent, with six sites having occupancies of ninety per cent – one hundred per cent. Only two of the fourteen sites have a form of charging.

Surveys have also shown that between thirty per cent – eighty per cent of people parked for more than four hours at eleven of the sites. Therefore nearly all of these free sites are showing high levels of all day parking and this may be due to people accessing employment nearby or parking before taking a bus into the city centre.

Many of these car parks are located adjacent to key arterial routes. The all-day parking that occurs at these sites impacts on adjacent shops and businesses by reducing opportunities for customers to park. This indicates that the lack of charging at these sites can encourage longer duration parking, which reduces space turnover and availability.

### Residents parking

There are some areas within the Controlled Parking Zone such as the Market area, Sandy Row etc where the level of driveway parking provision is not generally commensurate with car ownership levels in these areas. The lack of an on-street parking regime encourages commuters to park in these predominantly residential areas.

The impacts on residential communities also extend further out of the city centre. Areas such as Lower Malone, Stranmillis and College Park Avenue / Rugby Road also experience issues from people who park all day in the area but do not live locally, as well students utilising the surrounding education institutions. This results in excessive parking demand throughout the day.

This means that when space is occupied by workers or students, local residents find it difficult to park outside or near to their houses. Parking is also at a premium for local businesses in these areas. There is also reason to believe that commuters are travelling into these areas from further afield and then getting the bus or walking into the city centre.

These largely residential areas, in addition to those within the city centre, have been considered for Residents Parking Schemes in the recent past. Residents Parking Schemes assign on-street spaces to residents and local businesses by way of a permit, thereby preventing use of the space by non-residents and businesses outside the area.

### Park and Ride

Parking on or adjacent to the major radial routes into the city centre has received attention in part due to the implementation of the Quality Bus Corridors. On-street parking provision on the main arterial routes such as the Ormeau Road and Newtownards Road is enforced by the use of Urban Clearways and bus lane operation restrictions during peak periods.

A large number of Park and Ride sites have been implemented in the last decade by Translink and DfI throughout the region. These provide parking nodes for users to avail of bus and rail services into the city centre and include sites at Dundonald, Cairnshill and Sprucefield. Parking is free and users only pay for the cost of travel, thereby removing car traffic from radial routes and the city centre.

However there are some disparities between the cost of onward public transport travel from these sites and the cost of city centre parking. If it is possible to park in the city centre for less than it would cost for a return journey utilising a Park and Ride site, users will be

unlikely to make the switch. For example, users who currently make use of free on-street parking in city centre residential areas such as the Market area or who benefit from a reduced price city centre PNR space would, in either instance, be unlikely to start using Park and Ride.

The provision of Park and Ride Strategy servicing the city must be accompanied by additional measures for example improved bus journey times through implementation of further priority measures, or if city centre parking is made less cost attractive this could attract users over to Park and Ride. Similarly, some radial routes into the city centre such as Castlereagh Road do not benefit from significant Park and Ride provision, yet this could influence the proportion of car journeys made along this corridor.

### 2.4. Policy

Key policy documents that have shaped transport, parking and planning policy include:

- Regional Development Strategy 2035;
- Regional Transportation Strategy 2002 2012;
- Belfast Metropolitan Area Plan 2015;
- Belfast Metropolitan Transport Plan 2015;
- Belfast City Council Transport Policy;
- DOE Parking Standards;
- Belfast Air Quality Action Plan 2015 2020;
- Strategic Planning Policy Statement for Northern Ireland; and
- Planning Policy Statements (PPS3 and PPS13).

These policies, which the strategy aims to support, are typical of those implemented in many other UK and Ireland cities, and in relation to parking they are generally in accord and include concepts such as managing demand, reducing supply of all day parking, having parking controls and areas of restraint, and influencing parking behaviour.

Specific actions include reducing the supply and increasing the cost of commuter and long stay parking in Belfast city centre; reducing the reliance on the private car; introducing strategic Park and Ride sites at key locations; restraining the level of PNR parking provided for new city developments; introducing residents only parking schemes and cycle parking.

Of particular note is the Air Quality Action Plan which sets out measures to be implemented throughout Belfast to attain compliance of the nitrogen dioxide EU limit. As such the council identified four Air Quality Management Areas (AQMAs) namely:

- M1 Westlink:
- Cromac Street and Albertbridge Road;
- Upper Newtownards Road; and
- Ormeau Road.

As such it is noted that a number of car parks are located within or adjacent to these four areas. As traffic volumes and congestion have a direct bearing on air quality, the role that car parks have on these individual areas should be of concern.

The Parking Standards applied to new developments also have a significant bearing on the level of parking provided. Whilst on the whole the current policy is similar to that employed in many other UK and Irish cities, the standards applied within areas of parking restraint are generic and not specific to the development type. This means that in some instances the level of parking required in the standards is not actually suitable for the development being planned. Therefore, adding greater clarity to the parking standards could result in more appropriate levels of parking associated with new developments.

# Key issues and challenges

### 3.1. Key issues

The baseline review has indicated that there is sufficient parking stock in Belfast and this should be kept under review and closely monitored. There are 28,300 spaces publicly available (forty-five per cent on street and fifty-five per cent off street) and demand indicates a requirement for 18,000 on average per day in Belfast. The council has responsibility for seventeen of the fifty-nine off-street car parks containing 1,476 parking spaces. The number of car parking spaces provided in Belfast is considered to be high compared to other cities of similar size.

Whilst there is currently sufficient parking stock in terms of overall spaces the provision is fragmented and imbalanced across the city centre. The current location of car parking spaces, particularly surface car parking, is not necessarily aligned to existing demand or to future redevelopment proposals, particularly in the context of the City Centre Regeneration Strategy. The provision and location of parking should reflect the changing shape of regeneration across the city.

There is a high level of all day commuter parking in specific areas of the core city centre area and it reduces the amount of short stay opportunities for shoppers, business meetings and other visitors. Commuter parking in city centre residential areas is a known issue and individual Residents Parking Schemes have been developed by DfI, however to date none of these schemes have been implemented.

There is a high level of private non-residential parking (10,422 spaces) provided in the core and fringe city area which encourages the use of the private car. This is generally free car parking provided to employees as part of public and private office developments. Parking tariffs in Belfast are comparable with cities such as Newcastle and Nottingham, but generally cheaper than cities such as Manchester, Dublin and Cardiff. Council site tariffs were found to be generally lower than those in adjacent private sites.

There is a lack of information for visitors as to where available parking is located resulting in circulating traffic looking for available spaces contributing to congestion in the city which could be more efficiently managed. Site audits have identified that some car parks are of low quality in terms of facilities and provision for users which leads to security and crime issues impacting on parking behaviour in the city.

There are a number of low quality surface car parking sites in the city centre where consideration should be given to maximising their wider regeneration potential. Consolidation of existing surface parking or alternative provision could potentially be facilitated as part of any new development or consideration given to the provision of new multi storey/underground car parks. This would allow better use of valuable city centre land and bring wider economic and regeneration benefits, as well as concentrating traffic movements to fewer parking sites.

Parking is not seen as a major decision factor by investors, particularly as other cities do not have significant city centre parking although it was noted that many other cities have a range of alternative sustainable transport options.

Potential solutions that could be implemented through the introduction of new technology include more efficient enforcement, development of a Belfast parking website and app, improving parking information as you approach the city (city wide Intelligent Transport System, innovative wayfinding and upgrading payment methods).

Accessible parking in Belfast city centre is limited in comparison to the number of standard spaces available. Blue badge holders can park for free on-street if the blue badge is clearly displayed. A review of the existing provision of accessible parking has indicated that Blue Badge provision could also be considered within the council's off-street car parks. Issues of parking in some district centres outside the city centre has been raised, in particular the use of free car parks for all day commuter parking in areas such as East Belfast.

Coach parking provision is limited within the city in particular for overnight or long stay parking. There is a need to improve the provision in order to facilitate the growing tourism sector.

Although positive steps have been taken to address the environmental issues caused by vehicle traffic in the City, some areas still experience issues with four Air Quality Management Areas identified. The council has noted reductions in some pollutants, however parking activity in these areas may be contributing to the issues.

### 3.2. Challenges and opportunities

Major Masterplans, regeneration projects, highways schemes, planning applications and development proposals have been considered in terms of loss/gain of parking provision within the city. Despite possible forthcoming losses of parking provision (i.e. over 1,000 spaces overall across the city), these projects will add to the overall attractiveness of the city. They will also change the use of some current surface parking sites to more appropriate uses.

Development proposals include additional parking, largely in the form of multi-storeys which will be publically available (i.e. around 2,000 spaces), however it should be noted that this will primarily accommodate the additional traffic generated by these developments. In particular it is anticipated that there will be a change in provision in the north of the city centre due to a number of development and transport scheme proposals in that area. These will result in the loss of around 850 existing spaces however this could be compensated to some extent by provision of around 1,390 spaces, although these will primarily serve development.

Ulster University is relocating to the north of the city centre which will cause an influx of students to the city therefore consideration should be given to the impact on parking and public transport. The opportunity exists to influence travel behaviour at the onset, away from private car use and parking via further investment and upgrade of existing public transport facilities in the area.

It has also been identified that electric vehicle (EV) use is increasing in Northern Ireland and additional charging points could assist in wider EV uptake with associated air quality benefits arising as a result.

The need for Residents Parking Schemes is evident however their delivery has stalled. While there are still intentions to implement these schemes, it is clear that a revised approach is needed in order to gain stakeholder support. This needs to consider a number of factors and leadership is required.

The upgrade of Great Victoria Street train station and Europa Bus centre as part of the £120m Belfast Transport Hub proposals will provide additional services for both bus and rail travel in the city, making the use of sustainable modes of travel more attractive.

Figure 5: Belfast Transport Hub / Weavers Cross masterplan (Translink)

The implementation of the £98.5m Belfast Rapid Transit (BRT) system, which is a new bus-based public transport service will help to address the current and future transport needs in west and east Belfast and support sustainable economic growth and regeneration. BRT will provide a modern, safe, efficient and high quality service which will encourage people to travel by public transport. It will help to integrate communities and link people to jobs, shops, leisure, health and education services. The BRT network will initially include three rapid transit routes, which will link East Belfast, West Belfast and Titanic Quarter via the city centre. Construction of the BRT infrastructure commenced in 2014 and should be complete by 2018.

Figure 6: Belfast Rapid Transit – Glider Routes (Dfl)

DfI recently published their Bicycle Strategy which seeks to transform cycling in Northern Ireland over the next twenty-five years. Its three pillar approach seeks to build a comprehensive bicycle network, support people who choose to cycle and promote the bicycle as a mode of transport for every day journeys. An element of the delivery of the bicycle network is cycle parking, and surveys have shown that public awareness of bike routes and parking is currently low, particularly amongst local residents. The opportunity therefore exists to assist with delivery of this key element of the Bicycle Strategy and increase cycling levels amongst the resident population.

4 Objectives

### 4.1. Vision

Our vision for this strategy is as follows:

"Belfast is a city offering sufficient, high quality and appropriately located parking which supports economic development and regeneration within the city by balancing the requirements of residents, businesses, commuters and visitors."

To enable this to happen, a number of objectives have been developed that the strategy should meet. These are based on the wider aspirations and goals of the council and also follow the analysis of the issues and challenges identified and discussed in the previous two chapters.

Objective 1 - Ensuring appropriate provision and location of car parking to support and improve the economic vitality of the city centre and district centres.

The appropriate level of parking within the city has a crucial part to play in its economic vitality. However, an overabundance of parking will add to the current traffic congestion problems which will detract from the attractiveness of the city from an investment perspective as well as being detrimental to the environment.

The location of parking also has a crucial part to play. One large multi-storey/underground car park could perform the same function of four or five small surface sites. It is a better use of valuable city centre land and more efficient in terms of traffic movements and it also frees up surface sites for regeneration and development.

### **Council priorities**

- Review current provision to ensure an appropriate provision in the right location to support economic vitality.
- Consider how optimal use can be made of surface car parks to best support city centre
  regeneration in terms of alignment of provision with re-development and maximising
  valuable city centre land to deliver on wider regeneration outcomes.
- Identify opportunities to consolidate existing parking or alternative provision as an integral part of new development and consider provision of new multi-storey /underground car parks where appropriate. Adjacent local communities will be consulted on location and design.

Objective 2 - Ensuring car parking provision encourages sustainable commuter travel, especially for journeys into the city centre and supports access by public transport, cycling and walking.

Parking availability, cost and ease of use have a direct impact on people's choice of mode of transport and therefore there is potential to cause traffic congestion and to undermine the viability of sustainable transport options. The level of parking provision is therefore a key demand management tool as managing the amount of parking provides a form of restraint that can help to limit traffic levels and also strongly influence modal shift.

### **Council priorities**

- Work with stakeholders to consider how parking tariffs in the city centre core can be reviewed to ensure sufficient short-stay parking facilities to support commercial and leisure activities and deter long stay commuter parking.
- Work with stakeholders to develop and improve the sustainable transport modes of travel to / from and within the city, in particular to deter all day commuter parking.

Objective 3 - Minimising the potentially negative impacts of parking on residential communities in the city particularly in inner city areas.

Commuters use inner city residential areas in Belfast to park in order to avail of free parking facilities within walking distance of a workplace. This has negative effects on residential communities in terms of accessibility to residents' homes, area safety and access for services e.g. ambulances. A review of criteria for implementation, scheme design, operational times and community support should be considered in order to increase the potential for delivery.

### **Council priorities**

- Work with Dfl and local communities to consider parking management for inner city areas, either through the implementation of on-street parking regimes or Residents Parking Schemes.
- Identify surface car park sites suitable for consolidation and redevelopment in order to improve the built environment for inner city areas.

Objective 4 - Work with stakeholders to improve the quality of parking and information available, ideally through technology and in particular develop a new parking signage and information system that supports parking and wider applications.

The provision of high quality and safe car parks is an important element as it is often the first impression for visitors to the city. Better provision in terms of parking information and quality should be sought and importantly the need to ensure parking is sufficiently attractive to those with limited mobility or with families.

### **Council priorities**

- Bring forward technological solutions to make it easier to navigate and park in the city centre.
- Work with key stakeholders to ensure that key destinations have appropriate levels of disabled parking and family friendly provision.
- Encourage car park operators to invest in their facilities to the extent that they will achieve the Park Mark standard.
- Reduce supply of poor quality surface level space and replace with higher quality wellmanaged space.

### **Complementary objectives**

There are also a further three complementary objectives:

- Promote sustainable commuter travel, especially for journeys into the City centre and support access by public transport, cycling and walking.
- Identify opportunities to provide secure bicycle and coach parking in appropriate city centre locations.
- Ensuring appropriate provision for taxis within the city centre.

# The Strategy

### 5.1. Parking provision

Parking provision has a significant impact on economic vitality and should not encourage less sustainable commuter travel. The strategy addresses three broad areas in relation to parking provision within the city:

### Parking supply:

- a) The current level of city centre parking supply will be maintained in order to provide opportunities for short stay parking, however demand will be regularly monitored.
- b) Extend current controlled on-street parking zones in the city centre core.
- c) City centre surface parking sites should be redeveloped for other uses and parking acts migrated into multi-storey sites.
- d) New car parks within the city will only be provided where they replace existing spaces or where they are an essential part of new development proposals.
- e) Parking standards for new development across the city should not encourage car commuting and the associated overspill onto neighbouring streets.
- f) The amount of private non-residential (PNR) parking provided across the city will be more tightly controlled in order to influence traffic demand in the city centre.
- g) Consider parking initiatives to promote the evening economy and provision to cater for overnight/weekend visitors to hotels.

### **Parking location:**

- a) Long stay parking should only occur in off-street sites away from central areas of the city centre.
- b) Central areas should only be used for short stay parking.
- c) On-street parking in the city centre core should only be used for short stay parking and for those with Blue Badges.

### **Parking Price:**

- a) Tariffs for on and off-street parking should be reviewed, including consideration of variable pricing.
- b) Pricing should reflect the desirability of central areas.
- c) Long stay parking in suburban areas should be charged in order to increase turnover and maintain space for access to local services.
- d) Pricing should encourage space turnover in desirable areas.
- e) Parking cost should be comparable with other transport options such as public transport.

### 5.2. Residential communities

The need to support the city's residential communities through parking interventions is also an important objective. As part of the strategy, a review of criteria for implementation, scheme design, operational times and community support should be considered in order to increase the potential for delivery of residents parking schemes. The council will work with the relevant agencies and stakeholders to facilitate the implementation of schemes within applicable areas of the city centre.

### 5.3. Parking information and quality

In order to improve the quality of parking and information available, the strategy will address the following:

- Investigate options for utilising technology to improve ticketing and payment systems.
- Provide more information for visitors via electronic media including a dedicated website and app.
- Assess the feasibility of an integrated signage system for the city centre and wayfinding for individual areas.
- Look to integrate parking payment and management technologies with information systems within a single comprehensive city wide system.
- Raise the standard of parking facilities, including those with families or limited mobility.
- Encourage car park operators to invest in their facilities to so that they can achieve the Park Mark standard.

### 6 Strategy Actions

The specific actions and measures that will underpin the strategy and support each of the objectives are outlined below:

### 6.1. Parking provision

### 6.1.a. On-street

In terms of on-street spaces, within the city centre core, there are still a number of locations where un-controlled parking remains (in fact there are still more uncontrolled than controlled spaces). While responsibility for on-street parking lies with DfI, the council will work with DfI to seek to achieve delivery of the following actions.

The current area of controlled on-street parking within the core should be extended either through the implementation of parking regimes or residents parking schemes. This will help reduce the extent of all day parking in these areas and facilitate for short term parking. It will also help to rebalance demand across the city centre.

Within the city centre fringe, parking studies should be undertaken to assess whether a form of parking restriction is required in each of the four sub-zones.

Furthermore, tariffs for on-street parking could be examined at a strategic level. It is apparent that parking costs within Belfast are competitive compared to other similar sized cities, and the premium nature of on-street spaces should be reflected in the cost. For example, charges could be based on the distance from City Hall, with an increasing cost based on proximity. This would ensure that turnover of the most valuable spaces would increase and the increased costs would deter users who feed the meter.

It is apparent that there is particularly high demand for charged on-street spaces in the south core area (Linenhall Quarter). Consideration of tariffs in this key business district should be heavily biased towards short stay parking in order to free up spaces for others.

Variable pricing should also be examined in order to influence parking demand at key times of the day or year. Similarly the operational hours of on-street spaces should be reviewed with a view to achieving a better balance with demand. For example this could mean lowering tariffs during late afternoon hours in order to stimulate the evening economy (most on-street and council sites are free after 6pm).

The ticketing and payment systems should be reviewed to assess whether further investments could improve use and enforcement. This would be in addition to the current provision delivered via 'parkmobile' for Dfl on-street and council off-street sites. For example, a cashless and ticketless payment system would allow users to purchase their parking act via phone or mobile app and provide their location and vehicle registration number. This could facilitate more targeted enforcement by enabling officers to only target those vehicles with registration numbers that the system was telling them had overstayed their time limits.

Similarly, parking bay monitors are an efficient way of managing high demand spaces. They detect when a vehicle is parked in an individual bay and can alert the parking provider when the parking act has extended beyond its time limit. This means that instances of 'feeding the meter' can be reduced and it also means enforcement can be more targeted. As such, **Dfl** should consider a pilot of parking bay monitoring for the areas of highest on-street demand i.e. Linen Quarter.

Free on-street parking for Blue Badge holders should remain. As such, these should be the only 'long stay' users parking on-street. Providing free parking for blue badge holders in off-street car parks is discussed in the next section.

No.	On-street action	Meets objective(s)
1	Extend controlled on-street parking area within the core. Dfl to undertake parking studies within the city centre fringe in consultation with the council.	1, 2, 3
2	Tariffs for on-street parking to be examined at a strategic level.	1
3	Variable pricing to be examined.	1
4	Review of ticketing and payment systems.	1, 4
5	DfI to consider a pilot of on-street bay monitoring.	1, 4
6	Free on-street parking for Blue Badge holders to remain.	1
7	Improved enforcement to reduce inappropriate parking such as pavement parking.	1, 3

Table 1: On-Street Actions

### 6.1.b. Off-street: Public parking

Parking surveys published by DfI indicate that while some individual car parks operate at capacity, there is spare capacity in the overall provision. There are key areas where charged on-street demand is high and at capacity and users who are parking for significant durations need to be encouraged to move to off-street sites in order to free up capacity.

Future proposals need to be considered including the impacts of the closure of some car parks due to development, transport schemes and regeneration initiatives such as the relocation of Ulster University to the north of the city centre. A seemingly high proportion of local university students nowadays live at home while studying and therefore have to travel to campus on a daily basis. The extension of charged on-street parking areas within the CPZ in tandem with the implementation of Residents Parking Schemes in the city centre core, fringe and also in areas of South Belfast also need to be considered as it could result in commuters relocating their parking acts.

It is proposed that the current parking stock is kept under review with demand levels regularly monitored. As the development market continues to improve, individual surface sites (in both private and public ownership) may become available for development, and these will be considered on a case by case basis to determine the impact on the overall parking stock.

It is clear that the overall parking experience needs to improve for users. Four out of five car parks in Belfast are surface car parks which offer very limited capacity and usually a lower quality experience than multi-storey car parks (MSCPs). In comparison with many other cities, the majority of Belfast's current MSCPs are modern. They also represent a good use of city centre space in terms of the number of spaces they provide for their area. **There should therefore be a shift away from surface car parking into multi-storeys.** 

There are currently fourteen MSCPs in the city centre compared to forty-five surface sites. The vast majority of these surface sites, irrespective of individual ownership, represent development opportunities. However, additional MSCPs should only be provided when a number of adjacent surface sites are closed and in consultation with adjacent communities. The individual council owned surface car parks should be considered for MSCPs as opportunities arise, however the council should seek to maintain a level of influence in the patterns of usage at these MSCPs.

The selection of individual MSCP locations will require careful consideration in order to avoid any detrimental impacts on air quality within the vicinity and impact on the local residential areas. However, advocating that surface car parks are eventually rationalised into MSCPs should result in reduced traffic volumes from fewer circulating vehicles. This will have benefits of reducing air pollution and improving road safety, particularly in AQMAs.

Furthermore the freeing up of city centre space for other use offers the potential to further 'green' the city and make it more liveable and walkable. The removal of unsightly swathes of surface parking will improve the feel of individual areas and encourage activity, permeability and footfall.

To add to the overall quality of the parking offer and thereby increase the willingness of users to pay, the council should encourage car park operators to invest in their facilities to the extent that they will achieve the Park Mark standard. This will include examining how car parks can be improved to reduce crime and the fear of crime, and should also consider how provision can be improved for disabled users and parents with children. This will include increasing the number of accessible spaces set aside for blue badge holders and families.

A shuttle bus could be considered with Translink which would connect all of the MSCPs and the main shopping and employment areas. This would operate at a high frequency and short journey time throughout the day. Integration with Translink's existing services should be considered.

Key to the delivery and management of parking across the city centre is the dialogue and cooperation of car park operators. While the vast majority of parking is provided by the private sector, there needs to be acknowledgement that parking requires careful management. For this reason it is recommended that a Parking Forum is developed which will include stakeholders from both the private and public sector. This will help to ensure a partnership approach to parking as part of the overall transportation strategy for the city. Collaboration within the Forum will result in greater clarity and information for users, encourage compliance with planning conditions, raise standards and manage parking prices.

A key action of the Parking Forum could be the development of a parking 'app' which could encompass all off-street parking sites within the city centre. Building on the popularity of existing apps such as 'parkmobile' (which is already in use at various sites), the dedicated city parking app could include information on the location of car parks (including Park and Ride sites), their typical occupancies at certain times of the day and their costs. This would provide information to users, enabling them to decide before they start their journey on where they would like to park. The system could also be used to pre-book and pay electronically for parking, increasing user confidence about parking availability.

The app should be marketed widely, enabling tourists to make use of it as they plan their trip to the city. Some parking apps include GPS routing to individual sites, thereby wastage mileage while users try to find a site, and this could also be included subject to users obeying traffic laws regarding mobile phone use while driving.

Private sector parking providers should be encouraged to consider investing in parking technology. For example, CCTV camera systems at the entrance to car parks can be used to record vehicle number plates on entry and exit, with the parking fee then drawn down directly from the user's online account.

The potential to extend free parking for Blue Badge holders to off-street sites was recently considered by Dfl however with the transfer of these sites to local councils it was recommended that councils take this matter forward. As such the extension of free parking for Blue Badge holders to off-street sites should be considered by the council in order to weigh up the potential impacts.

### 6.1.c. Off-street: Parking for development

The level of PNR parking within the city centre is considered to undo many of the efforts being made to promote sustainable transport and the mass movement of people into and out of the city. If users can avail of free or cheap work-based city centre parking, they will inevitably continue to commute by car.

No.	Off-street public and private parking action	Meets objective(s)
8	Keep current parking stock under review with demand levels regularly monitored.	1, 2
9	Identify opportunities to consolidate surface car parking as an integral part of new development or through new multi-storey /underground car park provision where appropriate.	
10	The council should encourage car park operators to invest in their facilities to the extent that they will achieve the Park Mark standard and increases spaces available for accessible and family parking.	4
11	A Shuttle Bus to connect all of the MSCPs and the main shopping and employment areas should be considered in consultation with Translink.	1, 2, 4
12	Establish a Parking Forum.	1, 2
13	Development of city parking app.	1, 4
14	Private sector parking providers should be encouraged to consider investing in parking technology.	1, 4
15	Consider extension of free parking for Blue Badge holders to off-street sites.	1, 4
16	Government and local authority bodies remove PNR space or charge for use.	2
17	Improve enforcement against car parks operating outside their planning conditions.	2
18	Parking Standards to be re-examined by development type.	2

Table 2: Off-Street Actions for Public and Private Parking

Whilst the level of PNR provision between older and newer developments has gradually declined as a result of planning policy, there still remains extensive provision. Some of this is provided by public sector bodies, yet this goes against broad government policy which seeks to reduce the dependence on the private car. Government and local authority bodies should therefore lead by example and seek to remove PNR spaces or charge users for use of the PNR spaces that they provide.

This will encourage users to consider other modes or parking opportunities, resulting in benefits to the city in terms of reduced congestion and therefore improved economic vitality. It is apparent from consultation that the provision of city centre parking for employees is not a critical factor in foreign direct investment decision making.

The level of contract parking offered by some existing city centre parking operators is over and above that stipulated within planning conditions and the **enforcement of these conditions needs to be improved** in order to manage parking demand.

Whilst the level of parking stipulated for new development within the current Parking Standards is broadly in line with other UK and Irish cities, it is recommended that the current parking standards for development within areas of parking restraint should be re-examined in order to provide greater clarity by development type.

### 6.1.d. Off-street: Council sites

### City centre

Whilst all of the council's seventeen city centre car parks are surface car parks, recent surveys have shown that they are well used on the whole; indeed only three sites show peak time occupancy of less than eighty per cent. The parking costs at these sites are generally lower than adjacent private sites and there is therefore the opportunity to re-examine the tariffs at each site. The council has recently invested in re-surfacing and provided accessible parking for blue badge holders and family friendly provision in some of these sites, therefore localised demand may increase in the short term.

Similarly some of the car parks have a high proportion of all day parkers despite their close proximity to central areas. This means that there is a lack of turnover of spaces for those who need to make shorter visits. The tariffs and permitted parking durations at these sites should be examined to relocate long stay users to areas further out. This will ensure that the most desirable car parks return the highest revenues and will encourage the 'walking city' approach whereby all day parkers can park on the edge and either walk or cycle into central areas.

Season tickets can currently be purchased at seven of the council operated city centre car parks, although the majority of these sites are on the edge of the city core. However the council could potentially remove the season ticket provision at the Cromac Street site in order to further discourage long stay parking in this area.

Some of the council car parks may be removed as part of upcoming development schemes. These include Bankmore, Corporation, Dunbar, Frederick and Station Street. Provision in the council's city centre car parks totals under 1,500 spaces and given historical observations it is considered that demand for these sites can be accommodated by adjacent car parks (particularly MSCPs) and through the delivery of additional MSCPs.

In the meantime it is proposed that all other council city centre car parks remain operational, although with a view to being incorporated and replaced by MSCP provision. In most towns and cities, local authorities provide a degree of parking themselves (either directly or via sub-contracts) and this helps to maintain influence within the market. It is recommended that local authorities should seek to have increasing (rather than decreasing) influence over parking within their jurisdictions as this assists wider aims for the overall transportation system such as promoting public transport use. This action will maintain the council's stake in parking and permit a level of influence. This will help to ensure the objectives for the city's multi-modal transportation system are not compromised.

In the north-west of the city centre, the Little Donegall Street, Kent Street and Smithfield sites could be subsumed within nearby existing MSCP (Castle Court, City Car Park) creating new provision if required. Similarly in the south-west, the Hope Street and Little Victoria Street sites could be considered in the same way given current MSCP provision at Dublin Road and Great Northern Car Park.

In the north/north-east, the Lancaster Street, Corporation Square and Exchange Street sites and other privately operated sites could be considered collectively. The general level of activity in this northern area will increase which may require additional MSCP provision over what is currently provided (St Anne's Square and Tomb Street), particularly around the North Street and Donegall Street area, however this will be agreed according to planning department requirements. It should also be noted that the assessment of development proposals in this area to date have not assumed the closure of the council's car park sites.

The area to the south-east, on the approach from Ormeau Road is considered to be a MSCP 'gap' which could subsume the Charlotte Street and Cromac Street sites and other privately operated surface sites.

It is acknowledged that the council cannot decide on how privately operated surface sites are taken forward however through engagement with stakeholders there is potential to achieve buy-in on more strategic objectives that will further promote the economic vitality of the city centre.

### **Outside of the city centre**

The council's parking sites outside of the city centre are predominantly free. There is high occupancy of these sites with a significant number of all-day parkers. If capacity is to be managed, this level of all day parking needs to be reduced.

This would free up spaces for people making short trips to the area for shopping, leisure, or business/ personal reasons. As such it is proposed that parking remains free in all sites for up to two hours. After this a charge per hour would apply in all fourteen car parks except for Shaw's Bridge which does not show any degree of all day parkers as it is primarily for leisure use.

This will ensure that the running costs of the car parks can be recouped and will ensure the ongoing vitality of these local areas. It is acknowledged however that such action could cause the relocation of all day parking to adjacent residential streets; **therefore a comprehensive plan for these areas should be developed in collaboration with Dfl before implementation of this regime.** 

No.	Off-street council site action	Meets objective(s)
19	Re-examine tariffs and permitted parking durations at all sites.	1, 2
20	Remove season ticket provision at certain sites (i.e. Cromac Street).	1, 2
21	Retain all council sites but with a view to incorporation within MSCP provision.	1
22	Introduce a modest charge after two hours at all non-city centre council sites apart from Shaw's Bridge. Parking to remain free for up to two hours.	1, 3
23	Consider impact of above on adjacent areas and develop plan prior to implementation.	1, 3

Table 3: Off-Street Actions – Council sites

### 6.2. Parking in residential areas

The council recognises that numerous inner city residential communities are affected by commuter parking. Commuters' consideration of pricing and car park location are key factors in their decision to avail of free parking areas in residential communities. Providing residents parking schemes in city centre areas and adjacent to arterial routes would alleviate significant commuter parking issues which currently deny local residents parking opportunities at their properties. It would also assist with wider integration with the aims of the city's multi-modal transportation system.

Although residents parking schemes have been considered for various city residential communities consensus was not reached on various aspects of the proposals including appropriate permit considerations and availability. The council in principle supports the implementation of residents parking schemes and acknowledges that further work is required to achieve consensus.

Previous consultations regarding the schemes were initially unsuccessful due largely to the cost of a Residents Permit and also the limitations of Visitors Permits. Enforcement of permits and schemes were also considered to be key to success. It was also found that different issues were pertinent in different areas.

Therefore the council will work with Dfl, local communities and stakeholders to help facilitate delivery of residents parking schemes in the near future that are specific to the areas of concern.

No.	Parking in residential areas action	Meets objective(s)
24	Support DFI to deliver Residents Parking Schemes in specific areas of city.	3

Table 4: Parking in Residential Areas Actions

### 6.3. Parking information

The clear disparity between the perceived and actual level of parking supply needs to be overcome. This strategy has given clear evidence for this; however the public's perception that space is at a premium needs to be changed.

This can be achieved by raising the awareness of wider parking opportunities within the city. This should also include notification of other transport modes available. Far more can be achieved with the likes of electronic media and it is recommended that in addition to the parking app, a dedicated parking website for the city is provided and linked to social media.

The website will raise wider awareness of parking in particular locations, pricing and availability and tackle the perception that parking spaces are hard to find. Car park operators could contribute to the provision of this system through involvement in the Parking Forum.

The city centre still lacks an integrated signage system, and it is recommended that the feasibility of implementing such an integrated signage system should be investigated.

This should include consideration of the specification required, the technology currently available as well as procurement and running costs.

However, as vehicle technology progresses there may be the opportunity to provide in-car information and guidance systems. As such this would negate the traditional large costs associated with signage infrastructure and the associated management systems. Therefore the feasibility of integrating parking payment and management technologies with information systems within a single comprehensive city wide system should be examined.

It is also recommended that a wayfinding signage scheme is developed for areas of the city centre. This could comprise colour-coded fixed plate signage which directs users to parking areas within the likes of the Cathedral or Linen Quarters. This would lead users directly to these areas, thereby boosting these local economies. It would also provide better information for users seeking to park in the early evening or attending one off events in these areas.

No.	Parking information action	Meets
		objective(s)
25	Dedicated Parking Website for city.	4
26	Investigate an Integrated Signage System.	1, 4
27	Investigate integrating parking payment, management technologies and	4
	information systems in a city wide system.	
28	Wayfinding signage scheme for individual areas of city centre, including cycling	4
	routes.	

Table 5: Parking Information Actions

### 6.4. Complementary actions

This section details the actions which have a complementary role within the parking strategy.

### 6.4.a. Promoting sustainable commuter travel

The provision of a new rail halt at Gamble Street in the north of the city centre could potentially reduce parking pressures in the area via modal shift. This would be particularly important given the relocation of Ulster University. As well as providing a convenient access point for education and work trips, the new halt would provide convenient access to the Cathedral Quarter.

The provision of new Park and Ride sites would reduce the amount of traffic entering the city centre and parking. There are a number of locations where there are gaps in the Park and Ride offer, and these could include:

- Park and Ride sites earmarked within BMTP but not yet implemented.
- Additional Park and Ride on Belfast radials e.g. Castlereagh Road.
- Additional Park and Ride on M2 and M5 Corridor.

**Improve parking at train stations (including for cycles)** makes the train more attractive to use thereby reducing parking pressure in city centre. A lot of investment in train station parking has been made in the past few years and this has proved popular, however further provision will be required as the city's attractiveness grows.

### 6.4.b. Coach and cycle parking

It is recommended that further work is carried out to identify the preferred location of coach parking sites. This should include consideration of associated provision for tour operators such as coach parking maps.

Many of the Belfast Bike docking stations are within walking distance of city centre car parks.

The location of further docking stations will facilitate the gradual shift of off-street parking outside the core. There are currently thirty-three city centre docking stations however, more opportunities may arise to provide additional stations at new MSCPs.

To further promote cycling, the feasibility of providing a Cycle Parking Hub, located within the core of the city centre should be investigated. This should be located in a high visibility location and provide security for cyclists and biking equipment. Similar sites

provided elsewhere offer ample parking provision; CCTV, on-site attendants and include free pushchair loans for parents.

A review of the level of cycle parking provided for new developments should be undertaken in order to maximise the potential for cycle use for a variety of land use types. The council now have a planning role, and this should ensure that there is sufficient high quality cycle parking provided in order to encourage a modal shift to and from workplaces, shops and leisure complexes.

### 6.4.c. Taxi parking provision

**Parking for taxis needs to be examined citywide**. Ranks should be located in appropriate locations, where there is sufficient space and near to where customers are. The council will support efforts to provide suitable locations for taxi parking, acknowledging the competing demands for kerb space, in order to maintain the vitality of the city centre.

No.	Complementary Actions	Meets Objective(s)
29	Gamble Street Halt.	C1
30	New Park and Ride sites.	C1
31	Improve parking at train stations (including for cycles).	C1
32	Minimising traffic in the BMTP core.	C1
33	Review Park and Ride costs versus city centre parking charges.	C1
34	Confirm location of off-street coach park and provide facility.	C2
35	Consider additional Belfast Bikes docking stations associated with parking facilities.	C2
36	Examine feasibility of a Cycle Parking Hub.	C2
37	Review the level of cycle parking provided for new developments.	C2
38	Examine taxi parking provision citywide.	C3

Table 6: Complementary Actions

## Appendix

### **Glossary of terms**

Air Quality Management Area	Belfast City Council has a statutory duty to annually review, assess and report on air quality across the city. There are four designated AQMAs in Belfast where health based air quality objectives for nitrogen dioxide and particulate matter were exceeded.
Park Mark Standard	Awarded to parking facilities that have put in place measures to deter criminal activity and anti-social behaviour and have met the requirements of a risk assessment conducted by the Police.
Park & Ride	A system to encourage drivers to park away from the city centre and complete their journey by public transport.
Quality Bus Corridors	An initiative to give priority to buses, in order to reduce journey times and encourage use.
Rapid Transit	A form of high-speed urban passenger transport.
Residents Parking	An area where only vehicles with a valid permit or ticket can
Scheme	park during specified hours of operation.
Urban Clearway	A stretch of road in an urban area, where motorists are not permitted to stop during peak hours.

### **Abbreviations**

AQMAs	Air Quality Management Areas
ВМТР	Belfast Metropolitan Transport Plan
BRT	Belfast Rapid Transit
CPZ	Controlled Parking Zone
EV	Electric Vehicle
GPS	Global Positioning System
MSCP	Multi-Storey Car Park
PNR	Private Non-Residential
PPS	Planning Policy Statement
